

AgileEngine — Professional Intro Video Script

Ruben Dario Pinzon Eraso | DevOps Sr L3

Target length: 6–8 minutes at natural pace (~900–1,100 words)

Section 1 — Opening Hook

Timestamp: 0:00 – 0:30

[Look directly into the camera. Pause for one beat before speaking.]

Imagine you receive a call at 2 a.m. — a production cluster is down, thousands of users can't access the platform, and every second of downtime costs real money. [slow down here] Most people panic. I get to work.

[slight smile]

That sense of calm under pressure, that obsession with finding the root cause and building something more resilient on the other side — that is what I bring to every team I join.

Section 2 — Who I Am

Timestamp: 0:30 – 1:30

[Relax your posture. Speak conversationally, as if talking to a colleague.]

My name is Ruben Pinzon. I'm a Senior DevOps Engineer based in Bogotá, Colombia, currently working at Globant as a DevOps Sr L3. I'm an Electronic Engineer by training, and I've been in the IT industry for over fifteen years — which means I've seen this field transform dramatically, and I've transformed right alongside it.

[pause]

I hold certifications in project management — PMP — networking — CCNA and CCNP — cloud architecture on Azure, and I'm also a Microsoft Certified Trainer. But honestly, certificates are just checkpoints. What I care about is impact: what happens when I show up on a project, and what shape it's in when I leave.

I'm fluent in Spanish as my native language, I work and communicate daily in English at a B2 Advanced level, and I'm picking up French on the side — because I believe that in a truly global environment, language is a superpower.

Section 3 — My Journey

Timestamp: 1:30 – 3:00

[Take a breath. This is a story — let it flow.]

My career didn't start in the cloud. It started on the ground, quite literally — pulling cables, configuring switches, troubleshooting Active Directory at two in the morning. In 2007, I joined Solosoft as a consulting engineer, and I learned something essential: technology is only as good as the people who understand how it connects.

[slow down here]

From there, I moved into administration roles — Level 1 at Getronics, working on the Citibank account, which taught me about enterprise-grade reliability expectations. Then infrastructure and security roles at Controles Empresariales and Compufacil. In 2012, I stepped into a leadership role as Infrastructure and Operations Leader at Berlitz, managing a team — that was the first time I truly understood that great engineers don't just solve technical problems, they enable other people to solve them too.

[pause]

The turning point came when I joined IFX Networks in 2013. I spent six years there, evolving from a Windows Administrator into an Infrastructure Admin Specialist. IFX was a regional ISP and data center provider, so the scale was serious — high-availability systems, multi-tenant environments, complex networking. That's where I stopped thinking of myself as a technician and started thinking like an architect.

[slight smile]

In parallel — and I say “in parallel” because I've never been someone who does just one thing — I was teaching. From 2009 through today, I've been an active Microsoft Certified Trainer at IT Talent Learning Solution, delivering training on Azure, Windows Server, and cloud fundamentals. Teaching forces you to understand something deeply enough to explain it simply. It made me a better engineer.

Then in 2020, Globant called. And everything came together.

Section 4 — What I Do Best

Timestamp: 3:00 – 4:30

[Lean forward slightly. This is where you show conviction.]

Let me tell you about three moments that I think define what I actually do best.

[pause]

The first one happened early in my time at Globant. A client's deployment pipeline was taking over forty minutes per release, and the development team had basically stopped doing continuous deployment — it was too painful. I sat down with the pipeline configuration, rebuilt the CI/CD flow using Azure DevOps, introduced parallel stages, added caching layers, and integrated SonarCloud for quality gates so feedback arrived early, not at the end. Within two sprints, we were deploying in under eight minutes. The team started shipping daily. That change wasn't just technical — it changed the culture of that delivery team.

[pause]

The second moment was a Kubernetes migration. A legacy monolith running on virtual machines, owned by a client who was nervous about containers, nervous about Kubernetes, nervous about all of it. I didn't just hand them a migration plan — I walked alongside them. I set up Grafana dashboards so they could see exactly what the cluster was doing at every moment. I ran workshops. I wrote runbooks they could actually use at 2 a.m. without calling anyone. By go-live, they were confident. That's the outcome I care about: not just a working system, but a team that owns it.

[slow down here]

And the third — this one is smaller in scale but maybe the most telling. A junior engineer on my team was stuck trying to understand why a Terraform plan kept failing in a staging environment. I could have just fixed it for him. Instead, I sat with him for an hour, walked through the state file, the provider configuration, the variable scope. He found the issue himself. [slight smile] He's a much stronger engineer today, and I think that's one of the best uses of a senior engineer's time.

Section 5 — Technical Depth

Timestamp: 4:30 – 5:30

[Speak with confidence but avoid rattling off a list — connect each tool to a purpose.]

In terms of where I live technically — my daily environment is Kubernetes and container orchestration, both vanilla Kubernetes and OpenShift. I work extensively with Azure: Azure DevOps, Azure CI/CD pipelines, infrastructure as code with Terraform, and cloud architecture across multi-environment setups.

For observability, Grafana is my go-to. For code quality and security scanning, SonarCloud fits into the pipelines I build. I've worked with Jenkins, GitLab, and Bitbucket depending on the client's ecosystem, and I'm comfortable with AWS as well — it's not my primary cloud, but I navigate it confidently.

[pause]

Security is not a layer I add at the end — it's a practice I integrate throughout. Network security, secrets management, access control, compliance scanning — these live inside the pipelines and the cluster configurations from day one.

And VMware and Hyper-V still appear in my world when clients have hybrid environments. I don't leave on-premises behind just because cloud is exciting. The best solutions meet clients where they actually are.

Section 6 — Why AgileEngine

Timestamp: 5:30 – 6:30

[This should feel genuine. Look directly into the camera. No reading, just talking.]

So — why AgileEngine?

[pause]

Honestly, a few reasons that I think are worth being direct about.

AgileEngine works with distributed teams across multiple countries and time zones, serving real product companies. That's exactly the kind of environment where I do my best work — not because I need the complexity, but because global teams surface the most interesting problems. You can't coast in that environment. You have to communicate clearly, build systems that other people can actually understand and maintain, and you have to earn trust across cultures and contexts.

[slow down here]

I've read about AgileEngine's approach to engineering culture — the focus on ownership, on growth, on giving engineers meaningful work rather than treating them as ticket-resolvers. That resonates with me. I've spent fifteen years building toward exactly that kind of professional environment. A place where technical excellence is respected and expected. Where the people around you push you to be better.

[slight smile]

And frankly, I'm at a point in my career where I want to work on products that matter, with a team that's serious about quality. I think AgileEngine is that team.

Section 7 — Closing

Timestamp: 6:30 – 7:00

[Sit up straight. Warm, direct, confident. End with energy.]

If you've made it to the end of this video — thank you. [smile]

I know job applications involve a lot of these, and I appreciate the time. I'm genuinely excited about the possibility of joining AgileEngine, and I'd love the chance to go deeper in a conversation — about your current projects, your team's challenges, and how I might contribute.

[pause]

My name is Ruben Pinzon. I'm a Senior DevOps Engineer with fifteen years of experience, a passion for building reliable systems, and a genuine interest in the work that AgileEngine does.

Let's talk.

[hold eye contact for two seconds, then natural close]
